

Measuring Up to Standards: Valvular Quantification

Philips Ultrasound
Cardiology 102

This one-day program follows the recommendation for valvular quantification as outlined in various standards and guidelines. Hemodynamic function as well as structural anatomy will be reviewed.

Course description

Improvements in Doppler and in overall imaging allow visualization never before realized. This program will cover assessment of all four cardiac valves for both stenosis and regurgitation. Examples of correct and incorrect measurements will be given as well as explanation of what comprises a good quality measurement and why another is poor.

Educational material will be presented in the form of lectures and case presentations.

Course objectives

Upon completion of this program, attendees should be able to:

- Describe the basics of image optimization
- Discuss structural features of the Aortic, Pulmonic, Tricuspid and Mitral valves.
- Explain common abnormalities of all cardiac valves
- Identify methods for quantification of valvular stenosis.
- Identify methods for quantification of valvular regurgitation.
- Discuss the effects of multiple lesions on valvular assessment.

PHILIPS

Measuring Up To Standards: Valvular Quantification (CV102)

Ultrasound is the most commonly used test for the assessment of valvular performance. Non-invasive hemodynamic assessment and the unique ability to see the valves in motion under normal loading conditions is critical in the treatment of valvular disease.

Pre-requisite knowledge

A thorough knowledge and understanding of 2D echocardiography and system instrumentation is recommended for this program.

This course is intended for anyone who requires additional ultrasound knowledge.

Location

Course will be held at the various Philips training centers in Alpharetta, Georgia; Bothell, Washington; and Cleveland, Ohio. This program may also be offered in other regional locations.

Duration

1 Day
